## South Africa

South Africa's greenhouse gas (GHG) emissions mainly consist in CO<sub>2</sub> emissions from energy use (83%). In 2021, these emissions are priced through fuel excise taxes and carbon taxes. South Africa priced 45% of its carbon emissions from energy use and about 14% were priced at an ECR above EUR 60 per tonne of CO<sub>2</sub> (see Figure 3). Emissions priced at this level mainly originated from the road transport sector as well as the agriculture and fisheries sector. The majority of unpriced emissions from energy use were from the electricity sector (Figure 2). Other GHG emissions<sup>1</sup>, which made up about 17% of national emissions, were not covered by any carbon pricing instrument (see Figure 1).
