

France

Figure 1. Proportion of CO₂ emissions from energy use subject to different levels of effective carbon rates in France in 2018

Figure 2. Average effective carbon rates in France by sector and component in 2018

In 2018, effective carbon rates in France consisted of fuel excise taxes and to a smaller extent of carbon taxes and of permit prices from the EU-ETS. France priced about 79% of its carbon emissions from energy use and about 33% were priced at an ECR above EUR 60 per tonne of CO₂ (see top figure). Emissions priced at this level originated primarily from the road transport sector. The majority of unpriced emissions were from the industry sector and the residential and commercial sector.
