

Norway

Figure 1. Proportion of CO₂ emissions from energy use subject to different levels of effective carbon rates in Norway in 2018

Figure 2. Average effective carbon rates in Norway by sector and component in 2018

In 2018, effective carbon rates in Norway consisted of fuel excise taxes and to a smaller extent of carbon taxes and of permit prices from the EU-ETS. Norway priced about 81% of its carbon emissions from energy use and about 58% were priced at an ECR above EUR 60 per tonne of CO₂ (see top figure). Emissions priced at this level originated primarily from the road transport sector and the industry sector. The majority of unpriced emissions were from the industry sector and the residential and commercial sector.
