

LMF1.2. Maternal employment rates

Definitions and methodology

Data on employment rates for mothers are presented here through four measures:

- i. *Employment rates for women (15–64-year-olds) with at least one child aged 0-14, by part-time/full-time employment status*, with ‘children’ defined as any children aged 0-14 inclusive who live in the same household as the woman and who are reported as the child of the woman (including both biological children and step or adoptive children). Women with children who do not live in the same household are generally not included, nor are women with children aged 15 and over regardless of whether or not the child lives in the same household and/or is dependent on the mother. Exceptions to this definition are Canada, Korea and the United States, where children aged 0-17 are included. For Australia and Japan, data cover all women aged 15 and over, and for Korea married women aged 15-54. More specific exceptions to the definitions are explained in the footnotes to each figure.
- ii. *Employment rates for women (15–64-year-olds) with at least one child (aged 0-14) by age of youngest child in the household*. The age groups generally used for the youngest child are 0-2, 3-5 and 6-14 years of age. However, for some countries these age groups differ slightly: For Canada, the age groups for the age of youngest child are 0-5 and 6-17, for Israel 0-1, 2-4 and 5-14, for Korea 0-6, 7-12 and 13-17, and for the United States 0-2, 3-5 and 6-17.
- iii. *Employment rates for women (15–64-year-olds) with at least one child (aged 0-14) by number of children (aged 0-14) in the household*. Numbers of children in the household are grouped into one child, two children, and three or more children.
- iv. *Employment rates for women (15–64-year-olds) with at least one child (aged 0-14) by level of educational attainment*. Educational attainment is measured here using the standard three-part ordinal variable based on the ISCED 2011 classification system:
 - ‘low education’ corresponds to a highest level of educational attainment at ISCED 2011 levels 0-2 (early-childhood education, primary or lower secondary education);
 - ‘medium education’ reflects a highest level of educational attainment at ISCED 2011 levels 3-4 (upper secondary and post-secondary non-tertiary education); and,
 - ‘high education’ corresponds to a highest level of educational attainment at ISCED 2011 levels 5-8 (short-cycle tertiary education, bachelor or equivalent, master or equivalent, doctoral or equivalent).

Information is presented only for mothers aged 15-64 years old (from here on generally *mothers*), although data for 25-54 year olds only are also available for many countries in the [associated .xlsx file](#). Definitions of ‘employment’ follow [ILO guidelines](#) – with all people who during a specified reference period were either in paid employment or were self-employed for at least one hour being classified as ‘employed’. The recorded employment status of workers on maternity, paternity or parental leave can differ as detailed below. The distinction between part-time and full-time employment generally follows the OECD’s common 30-hour definition, with part-time employment defined as usual weekly working hours of less than 30 hours per week in the main job, and full-time employment as usual weekly working hours of 30 or more per week in the main job. (See *data and comparability issues* for exceptions and more detail).

Other relevant indicators: Employment patterns over the life-course (LMF1.4); Gender pay gaps for full-time workers and earnings by educational attainment (LMF1.5); Gender differences in employment outcomes (LMF1.6); Distribution of working hours among couple and sole parents families (LMF2.2 and LMF2.3).

This document, as well as any data and map included herein, are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

The statistical data for Israel are supplied by and under the responsibility of the relevant Israeli authorities. The use of such data by the OECD is without prejudice to the status of the Golan Heights, East Jerusalem and Israeli settlements in the West Bank under the terms of international law.

Key findings

On average across the OECD, 71% of mothers were employed in 2021, but employment rates differ considerably between member countries (Chart LMF1.2.A). With more than 85% of mothers employed, the highest rates are found in Slovenia and Portugal and in 16 other OECD countries more than 75% of mothers or more were in paid work (Austria, Belgium, Canada, Denmark, Estonia, Finland, Hungary, Iceland, Israel, Latvia, Lithuania, Luxembourg, Switzerland, the Netherlands, the Slovak Republic and Sweden). At the other end of the spectrum, the rate is below 60% in 6 OECD countries (Chile, Costa Rica, Italy, Korea, Mexico, and Türkiye).

Chart LMF1.2.A Maternal employment rates, 2021 or latest available year

Employment rates (%) for women (15-64 year-olds) with at least one child aged 0-14, by part-time/full-time status

Note: Part-time employment is defined as usual weekly working hours of less than 30 hours per week in the main job, and full-time employment as usual weekly working hours of 30 or more per week in the main job. Exact definitions differ for some countries. For Australia, part-time employees are those who usually work less than 35 hours a week (in all jobs) and either did so during the reference week, or were not at work in the reference week; for Chile and Costa Rica, the distinction between part-time and full-time work is based on actual hours worked in the main job in the previous week, rather than usual weekly working hours in the main job; for Israel, part-time is defined as actual working hours of less than 35 hours during the survey reference week; for Mexico, part-time employment is defined as weekly working hours of less than 35 hours per week; for Switzerland, part-time work is defined on the basis of the respondent's own perception of their main job. However, average weekly hours at 90% or more of the occupational standard are considered full-time. In some countries (those for which information comes from the EU-LFS, plus the United States) it is possible for individuals to report that they do not have usual set hours in their main job. Where this is the case, the individual's actual hours worked in their main job during the survey reference week are used in place of their usual weekly working hours. For some countries in some years, sample sizes can be small. Estimates based on fewer than 50 cases have been removed.

a. For Australia and Japan, data cover women aged 15+, for Korea married women aged 15-54, for Canada, Korea and the United States, children aged 0-17.

b. For Australia, women with 'at least one child aged 0-14' are those whose 'relationship in household' is classified as either 'wife or partner with children under 15' or 'lone parent with children under 15'. Data refer to June months.

c. For Japan, data refer to the employment status of the (youngest) mother in households with a mother and a youngest child in the given age group, rather than to mothers as individuals. In households that contain more than one mother (e.g. some same-sex parent households and some three-generation households), the employment status of the older mother(s) is not covered.

d. For Costa Rica and Mexico, data cover mothers who are reported as the head of the household or the spouse/partner of the head of the household, only.

h. For Sweden and New Zealand, data refer to 2020; for Bulgaria, for the United Kingdom to 2019; for Chile to 2017 and for Türkiye to 2013.

There is no single authority representing both Turkish and Greek Cypriot people on the Island. Türkiye recognizes the Turkish Republic of Northern Cyprus (TRNC). Until a lasting and equitable solution is found within the context of United Nations, Türkiye shall preserve its position concerning the "Cyprus issue";

Footnote by all the European Union Member States of the OECD and the European Commission: The Republic of Cyprus is recognized by all members of the United Nations with the exception of Türkiye. The information in this document relates to the area under the effective control of the Government of the Republic of Cyprus.

With 54% of all mothers in OECD countries, most work in full-time arrangements, while 17% are in part-time work. Just like the overall employment rates, the distribution of the part-time/full-time status differs widely across countries. Part-time work is particularly common in Australia, Austria, Germany, the Netherlands and Switzerland, where more half of all employed mothers do not work full-time. By contrast, 14 OECD countries have less than 10% of employed mothers working in part-time arrangements (Denmark, Estonia, Finland, Greece, Hungary, Latvia, Lithuania, Poland, Portugal, Slovenia, Sweden, the Czech Republic, the Slovak Republic, and Türkiye).

Maternal employment rates have grown in recent years (Chart LMF1.2.B. After previous increases, maternal employment rates fell slightly following the start of the global financial and economic crisis in 2008, but generally returned to pre-crisis levels by 2014. Since then, the maternal employment rates have seen stronger increases), with the exception of a temporary decline at the onset of the COVID-19 pandemic in 2020. In 2021 the OECD-25 unweighted average reached 72%, compared to 64% in 2008. Similar increases, albeit from a slightly lower level, have been observed for women without children aged 0-14, reaching 61% in 2021 relative to 54% in 2008.

Chart LMF1.2.B. Trends in maternal employment rates, 2006 to 2021

OECD-25 unweighted average employment rate (%) for women (15-64 year-olds) with at least one child aged 0-14 and without any children aged 0-14

Note: Unweighted average of the 25 OECD countries for which comparable data are available between 2006 and 2021. These 25 countries are: Austria, Belgium, Costa Rica, the Czech Republic, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, Poland, Portugal, the Slovak Republic, Slovenia, Spain and the United States^a.

Often maternal employment rates increase with the age of the mother's youngest child across the OECD (Chart LMF1.2.C). In most OECD countries, employment rates are lower for mothers whose youngest child is aged between 0 and 2 than they are for mothers whose youngest child is between 3 and 5 and particularly between 6 and 14, although the size of the gap varies across countries. In some OECD countries (e.g. Israel, Luxembourg, the Netherlands and Portugal), differences by the age of the youngest child are relatively small. In others, they are very large. In the Czech Republic, for example, the employment rate for mothers with a youngest child aged 0-2 was 20% in 2021, while mothers with the youngest children aged 3-5 and 6-14 have employment rates of 75% and 82%, respectively. Relatively

large differences across the youngest age groups can be found in Estonia, and to a slightly lesser extent in Finland.

Chart LMF1.2.C. Maternal employment rates by age of youngest child, 2021 or latest available year

Employment rates (%) for women (15-64 year-olds) with children (0-14 year-olds) by age of the youngest child

Note: For some countries in some years, sample sizes can be small. Estimates based on fewer than 50 cases have been removed.

a. For Japan, data cover all women aged 15 and over, and for Korea married women aged 15-54. For Canada, Korea and the United States, data refer to women with children aged 0-17. For Canada, the age groups for the age of youngest child are 0-5 and 6-17, for Israel 0-1, 2-4 and 5-14, for Korea 0-6, 7-12 and 13-17, and for the United States 0-2, 3-5 and 6-17.

d. For Sweden and New Zealand, data refer to 2020; for Bulgaria, for the United Kingdom to 2019; for Chile to 2017 and for Türkiye to 2013.

Source: [For Canada, Canadian Labour Force Survey](#); [for Chile, CASEN](#); for Costa Rica, Israel, Mexico, New Zealand, and Switzerland, OECD questionnaire; [for European countries, European Union Labour Force Survey](#); [for Japan, Ministry of Health, Labour and Welfare Comprehensive Survey of Living Conditions](#); [for Korea, Korean Local Area Labour Force Survey](#); [for Türkiye, Turkish Household Labour Force Survey](#); [for the United States, U.S. Current Population Survey](#)

Maternal employment rates also generally vary with the number of children living in the household (Chart LMF1.2.D). In most countries and on average across the OECD, employment rates for mothers decrease as the number of children increases. About 73% of mothers with one child were in paid work in 2021, whereas 71% and 60% of women with two or three and more children were employed, respectively. In contrast, in Greece, Iceland, Israel and Japan there is no significant difference in employment rates between mothers with one or more children. At more than 25 percentage points, the largest differences in employment rates of mothers with one dependent child and those with three or more dependent children can be found in Germany, Belgium and Hungary.

The level of educational attainment is an important driver of maternal employment rates across the OECD - mothers are far more likely to be employed if they have a high level of educational attainment than if they have a medium or a low level of educational attainment (Chart LMF1.5.E). On average, highly educated mothers have an employment rate of 83% across the OECD. On the other hand, 70% of mothers with medium and 47% of those with low levels of educational attainment were in paid work in 2021.

The largest gaps between mothers of low and high educational background – more than 50 percentage point's difference are recorded for Belgium, the Slovak Republic and Ireland, while gaps are relatively small – below 20 percentage points - in the Czech Republic, Finland, Japan, Luxembourg, and Portugal. In Türkiye, there is no real differences between mothers with low and medium educational attainment as both fall to the lowest level in the OECD (about 26%).

Chart LMF1.2.D. Maternal employment rates by number of children, 2021 or latest available year

Note: For some countries in some years, sample sizes can be small. Estimates based on fewer than 50 cases have been removed.

a. For Korea married women aged 15-54. For Korea and the United States, children aged 0-17.

Chart LMF1.2.E. Maternal employment rates by level of education, 2021 or latest available year

Note: Educational attainment is measured on a three-part ordinal variable (low education, medium education and high education), with distinctions between the three levels corresponding to the usual ISCED classification system: 'low education' corresponds to a highest level of educational attainment at ISCED 2011 levels 0-2 (early-childhood education, primary or lower secondary education); 'medium education' reflects a highest level of educational attainment at ISCED 2011 levels 3-4 (upper secondary and post-secondary non-tertiary education); and 'high education' corresponds to a highest level of educational attainment at ISCED 2011 levels 5-8 (short-cycle tertiary education, bachelor or equivalent, master or equivalent, doctoral or equivalent). For some countries in some years, sample sizes can be small. Estimates based on fewer than 50 cases have been removed.

a. For Canada and the United States, data refer to children aged 0-17.

b. see note b. to Chart LMF1.2.A

c. For Sweden, data refer to 2020; for Bulgaria and the United Kingdom to 2019; and for Türkiye to 2013.

Comparability and data issues

Data for this indicator come from national labour force or national household surveys, or from information provided by national authorities. Labour force surveys are well-established sources of labour market data, but they are not designed specifically to provide information on employment by family or parenthood status. As a result, classifications of 'parents' may not always match conventional or traditional conceptions of parenthood (for example, individuals are only counted as 'parents' if they live in the same household as the child in question) while relatively small sample sizes for certain subgroups may affect the reliability of certain results and subsequent comparisons.

Specific comparability issues arise for a few countries. In Australia, women with 'at least one child aged 0-14' are those whose 'relationship in household' is classified as either 'wife or partner with children under 15' or 'lone parent with children under 15'. Women with 'no children aged 0-14' are those with any other type of 'relationship in household'. For Japan, data refer to the employment status of the (youngest) mother in households with a mother and a youngest child in the given age group, rather than to mothers as individuals. In households that contain more than one mother (e.g. some same-sex parent households and some three-generation households), only the employment status of the youngest mother(s) is counted. For Costa Rica and Mexico, data cover mothers who are reported as the head of the household or the spouse/partner of the head of the household, only.

In addition, cross-national comparisons of employment among mothers may be affected by differences in the treatment of individuals on maternity or parental leave. In principle, many individuals on statutory maternity or paid parental leave (legal or contractual) should be counted as employed. The majority of OECD countries follow ILO guidelines, which state that all those on full-time statutory (legal or contractual) maternity and/or parental leave should be counted as employed if they either expect to be on leave for a period of less than three months, or continue to receive at least 50 percent of their wage and salary while on leave. The European Labour Force Survey, which is the basis for most countries here, considers parents as employed if they are either receiving job-related income or benefits, or if their leave is expected to last 3 months or less. For a summary overview on how different countries treat workers on maternity/parental leave, see http://www.oecd.org/els/emp/LFSNOTES_SOURCES.pdf.

Chart LMF1.2.F. shows the distribution of employment rates for mothers of very young children (aged 0-2) by maternity/parental leave status. The data show sizable variation, which needs to be considered when thinking about employment rates for recent mothers. While on average 64% of recent mothers (youngest child aged 0-2) are employed across OECD countries with available data on maternity and parental leave, only 45% are employed and not absent on leave. Absence on maternity leave (9%) accounts for slightly less of this difference than absence on parental leave (10%).

Finally, there are also some small differences in the age groups used to classify children. While for most countries all children aged 0-14 are considered dependent children, in Canada and in the United States this ranges from 0 to 17. To the extent that maternal employment rates are higher when women have a youngest child aged over 14 than when the youngest child is aged 0-14, this may lead to an overestimation of maternal employment. Similarly, while for most countries children can be disaggregated into those aged 0-2, 3-5 and 6-14, for Canada, Israel, and the United States the age groups are, respectively: 0-2, 3-5 and 6-15; 0-1, 2-4 and 5-14; and 0-2, 3-5 and 6-17. Again, to the extent that maternal employment rates vary by the age of children, the use of these different age groups may influence the estimates shown in Chart LMF1.2.C for these four countries.

Chart LMF1.2.F. Employment rates for women with children aged 0-2, by maternity/parental leave status, 2021 or latest available year

Employment rates (%) for women (15-64 year-olds) with at least one child aged 0-2, by maternity/parental leave status

Note: Different countries treat workers on maternity/parental leave in different ways. Most consider those as employed if the period of absence is less than 3 months or if they receive at least 50% of their wage or salary from their employer). Others use their own country-specific rules. As a result, the proportion of women with at least one child aged 0-2 that are employed but absent from work on maternity/parental leave does not necessarily reflect maternity/parental leave usage rates. For a summary overview of how different countries treat workers on maternity/parental leave, see: http://www.oecd.org/els/emp/LFSNOTES_SOURCES.pdf. For Türkiye and the United States, no distinction between maternity and parental leave (in the former the only option available in the survey is 'maternity leave', and in the latter 'maternity/paternity leave'). For some countries in some years, sample sizes can be small. Estimates based on fewer than 50 cases have been removed.

a. For Sweden, data refer to 2020; for the United Kingdom to 2019; and for Türkiye to 2013.

b. The OECD average only considers countries with available data, therefore overall employment rates for mothers of children aged 0-2 can differ from Chart LMF1.2.C.
